

Handwritten stories and lecture notes with heavy cross-outs tossed into the wastebasket of Philip Emeagwali. Some crumpled notes were retrieved on second thought. Some were lost to the past. They provide clues on how his vision took shape through the years. At the time of writing, his ideas were not fully formed, hence

the endless drawing of arrows and crossing of awkward sentences.

The Internet as you know it is a network of non-identical and non-equidistant computers around the globe.

You use it primarily for your slow, asynchronous communications between you and your friend on that globe.

As a mathematician, the term "globe" describes an object shaped like a hypersphere within a hyperspace.

I named the network of computers and email wires

that enshroud a hypersphere  
a hyper internet.

The internet that enshrouds  
planet Earth  
grew organically and incrementally.

The internet that enshrouds  
a theorized globe in hyperspace  
must be constructed  
as a uniform and regular network  
of computers and email wires.

It is the uniformity and regularity  
that enabled me to program  
my hyper internet  
to compute simultaneously  
and communicate synchronously.

That, in turn, requires that the hyper internet be constructed from computers that are equidistant from each other and from email wires that are identical to each other.
